Experiment No.8
Implementation of Views and Triggers
Date of Performance:
Date of Submission:

Aim :- Write a SQL query to implement views and triggers

Objective :- To learn about virtual tables in the database and also PLSQL constructs

Theory:

SQL Views:

In SQL, a view is a virtual table based on the result-set of an SQL statement.

A view contains rows and columns, just like a real table. The fields in a view are fields from one or more real tables in the database.

You can add SQL statements and functions to a view and present the data as if the data were coming from one single table.

A view is created with the CREATE VIEW statement.

CREATE VIEW Syntax

CREATE VIEW view_name AS

SELECT column1, column2, ...

FROM table_name

WHERE condition;

SQL Dropping a View

A view is deleted with the DROP VIEW statement.

SQL DROP VIEW Syntax

DROP VIEW view_name;

SQL Updating a View

A view can be updated with the CREATE OR REPLACE VIEW statement.

SQL CREATE OR REPLACE VIEW Syntax

CREATE OR REPLACE VIEW view_name AS

SELECT column1, column2, ...

FROM table_name

WHERE condition;

Trigger: A trigger is a stored procedure in the database which automatically invokes whenever a special event in the database occurs. For example, a trigger can be invoked when a row is inserted into a specified table or when certain table columns are being updated.

Syntax:

```
create trigger [trigger_name]
[before | after]
{insert | update | delete}
on [table_name]
[for each row]
[trigger_body]
```

Explanation of syntax:

1. `create trigger [trigger_name]`: Creates or replaces an existing trigger with the `trigger_name`.
2. `[before | after]`: This specifies when the trigger will be executed.
3. `{insert | update | delete}`: This specifies the DML operation.
4. `on [table_name]`: This specifies the name of the table associated with the trigger.
5. `[for each row]`: This specifies a row-level trigger, i.e., the trigger will be executed for each row being affected.
5. `[trigger_body]`: This provides the operation to be performed as trigger is fired .

IMPLEMENTATION:

```
1 • CREATE VIEW SongAlbumView AS
2 SELECT Song.Title AS SongTitle, Album.Title AS AlbumTitle, Artist.Name AS ArtistName
3 FROM Song
4 JOIN Album ON Song.AlbumID = Album.AlbumID
5 JOIN Artist ON Album.ArtistID = Artist.ArtistID;
6
```

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

```
albums albums artists x
Limit to 1000 rows
-- Create a trigger to update the view when new songs or albums are added or updated
DELIMITER //

CREATE TRIGGER UpdateSongAlbumView AFTER INSERT OR UPDATE ON Song
FOR EACH ROW
BEGIN
    -- Update the SongTitle in the view
    UPDATE SongAlbumView
    SET SongTitle = NEW.Title
    WHERE SongTitle = OLD.Title;

    -- Update AlbumTitle and ArtistName in the view
    UPDATE SongAlbumView
    SET AlbumTitle = (SELECT Title FROM Album WHERE AlbumID = NEW.AlbumID),
        ArtistName = (SELECT Name FROM Artist WHERE ArtistID = (SELECT ArtistID FROM Album WHERE AlbumID = NEW.AlbumID))
    WHERE SongTitle = NEW.Title;
END //
```

Result:

Result Grid							
Filter Rows:		Export:		Wrap Cell Content: I			
Trigger	Event	Table	Statement	Timing	Created	sql_mod	
customer_operation_trigger	INSERT	customer	BEGIN INSERT INTO customer_log (action, C...	AFTER	2024-04-20 15:23:42.99	ONLY_FU	

Conclusion:

1. Brief about the benefits for using views and triggers.

Views simplify queries, enhance security, abstract table structures, and optimize performance. Triggers enforce data integrity, audit changes, enforce business logic, and support replication.

2. Explain different strategies to update views

Updating views can be done directly, by updating base tables, using triggers, or by recreating views. These methods offer varying degrees of control and are applied based on the view's complexity and update requirements.
